

# Angad Muthyala

DevOps Engineer · Cloud & Infrastructure · Backend Developer

Mumbai, India | +91-8779263718 | [angadmuthyala@gmail.com](mailto:angadmuthyala@gmail.com) | [GitHub](#) | [LinkedIn](#)

## SUMMARY

I am a DevOps Engineer and Backend Developer who builds infrastructure for a live SaaS product from scratch, managing everything from CI/CD and secrets to monitoring. I design staged GitHub Actions pipelines with Trivy and SonarCloud security checks, provision AWS Kubernetes infrastructure using Terraform, and ensure seamless, zero-downtime updates via ArgoCD and Prometheus. On the backend, I write the core APIs using NestJS, design PostgreSQL databases, and build custom Grafana dashboards to track product performance.

## TECHNICAL SKILLS

**CI/CD & GitOps:** Jenkins, GitHub Actions, ArgoCD, Helm, GitOps two-repo pattern  
**Cloud (AWS):** EC2, S3, VPC, IAM, ECR, EKS, AWS Config, OIDC Auth, CloudWatch  
**Infrastructure:** Terraform, Ansible, Checkov, tfsec, HashiCorp Vault, Sealed Secrets  
**Containers & K8s:** Docker, Kubernetes, Helm, RBAC, Ingress, HPA, Kustomize  
**Observability:** Prometheus, Grafana, Alertmanager, Fluent Bit, OpenSearch, OpenTelemetry  
**Security & Auth:** Trivy, SonarCloud, OWASP, OPA/Kyverno, AWS Config Rules, JWT, Passport, bcrypt  
**Languages:** Python (boto3, FastAPI), Go, TypeScript, Bash  
**Backend & APIs:** NestJS, Node.js, Flask, REST APIs, BullMQ (job queues)  
**Database & Cache:** PostgreSQL (Neon), Prisma ORM, MySQL, Elasticsearch, Redis (Upstash)  
**AI & ML:** Groq API (Llama 3.3 70B, Llama 3.1 8B), OpenAI Whisper  
**Media & Tools:** FFmpeg, WebRTC, Nodemailer

## EXPERIENCE

### Backend Developer Intern

Nov 2025 – April 2026

*AI BI Street Pvt. Ltd*

*Mumbai, India*

- Interview Screener — live | Stack: NestJS, Next.js, PostgreSQL
- Sole backend engineer building and maintaining the complete API for an AI-powered video interview platform — with recruiter and candidate workflows in active use
- Designed the full interview lifecycle — question sets, timed WebRTC-based video recording with chunked upload support for unstable connections, candidate invitation flows, and token-signed magic-link authentication across three user roles (org POC, org admin, candidate)
- Architected a three-stage async media processing pipeline using BullMQ queues on Upstash Redis — FFmpeg video compression, Whisper transcription, and Groq LLM evaluation — with exponential backoff retry and job persistence
- Built the AI interview prep generator — ingests PDF resumes, scrapes job URLs, uses a 3-pass Groq editorial pipeline (generate, critique, rewrite) to produce structured PDF preparation materials via PDFKit
- Replaced a broken local-filesystem approach with Cloudflare R2 object storage across the entire processing chain — upload, compressed video, audio extraction — eliminating ENOENT failures and enabling zero-egress streaming via presigned URLs
- Architected the subscription model with middleware-level feature gating (checkLimit / incrementUsage against plan.features) and defined the full REST API contract across recruiter and candidate roles -JWT guards, class-validator DTOs, Prisma schema, and error handling included

## PROJECTS

### Production CI/CD Pipeline | Jenkins, Terraform, AWS EKS

[GitHub](#)

- Designed an 8-stage Jenkins pipeline — lint, SonarCloud SAST, Docker build, Trivy CVE scan, ECR push, Terraform apply, EKS deploy, boto3 smoke test — with hard-fail gates at each security step
- Provisioned AWS infra (VPC, EKS, ECR, S3, IAM) via Terraform modules with remote state in S3 + DynamoDB lock; used OIDC auth — zero long-lived AWS keys in CI
- Added Checkov and tfsec IaC security gates; enforced hard-fail on CRITICAL misconfigs and resolved 12 real violations surfaced by the scanners
- Deployed kube-prometheus-stack via Helm; authored PromQL alerting rules routed to Slack through Alertmanager; built a Grafana dashboard surfacing pod CPU, memory, request rate, and error budget in a single view

### Secure CI/CD Pipeline on Local Ubuntu | Jenkins, SonarQube, Trivy, Docker Compose

[GitHub](#)

- Built a fully local, cost-free DevSecOps pipeline — Jenkins (master + SSH agent), SonarQube, and PostgreSQL orchestrated via a hardened Docker Compose stack (read-only containers, tmpfs, no-new-privileges) on a single Ubuntu server
- Configured a Jenkins SSH build agent and connected it to the master over a shared Docker bridge network for isolated, distributed pipeline execution
- Integrated SonarQube static code analysis into the pipeline using a global token and the SonarQube Scanner plugin, gating builds on code quality before deployment
- Added Trivy container image scanning (HIGH/CRITICAL severity) for both frontend and backend images, archiving scan reports as Jenkins build artifacts

- Authored a declarative Jenkinsfile automating checkout, dependency install, SonarQube analysis, Docker image build, Trivy scan, Docker Hub push, and remote deployment via SSH + Docker Compose on the same host
- Go Profiler** | *CLI Performance Analyzer for Go* GitHub
- Parses Go source files using the AST to flag anti-patterns — string concatenation inside loops, deferred calls in hot paths, unnecessary allocations — and prints file-and-line-level fix suggestions to stdout

## LEADERSHIP & COMMUNITY

---

### Campus Lead

2024 – 2025

*FossUnited*

*Forum*

- Conducted multiple seminars demystifying open-source development and demonstrating how to start contributing to real-world projects. Ran hands-on workshops covering the Linux command line, Git workflows, shell scripting, and introductory Python to equip students with practical skills for immediate application.

## EDUCATION

---

### University of Mumbai

Mumbai, India

*B.E. in Computer Science*

*Graduated Apr 2026*
